

TELARIS

Editor Quick Start

The shortest path from your credentials to your first wormhole.

FIVE MINUTES. ONE WORMHOLE.

V0.1

Quick start

This is the short version. Five steps, four pages, and you have published your first wormhole. For everything beyond the basics (portals, the keyword canvas, tours, multigalaxy views, troubleshooting, the why-and-why-not of editorial choices), the full **Editor Manual** is available at:

<https://www.telaris.ca/docs/editor-manual.pdf>

What you need

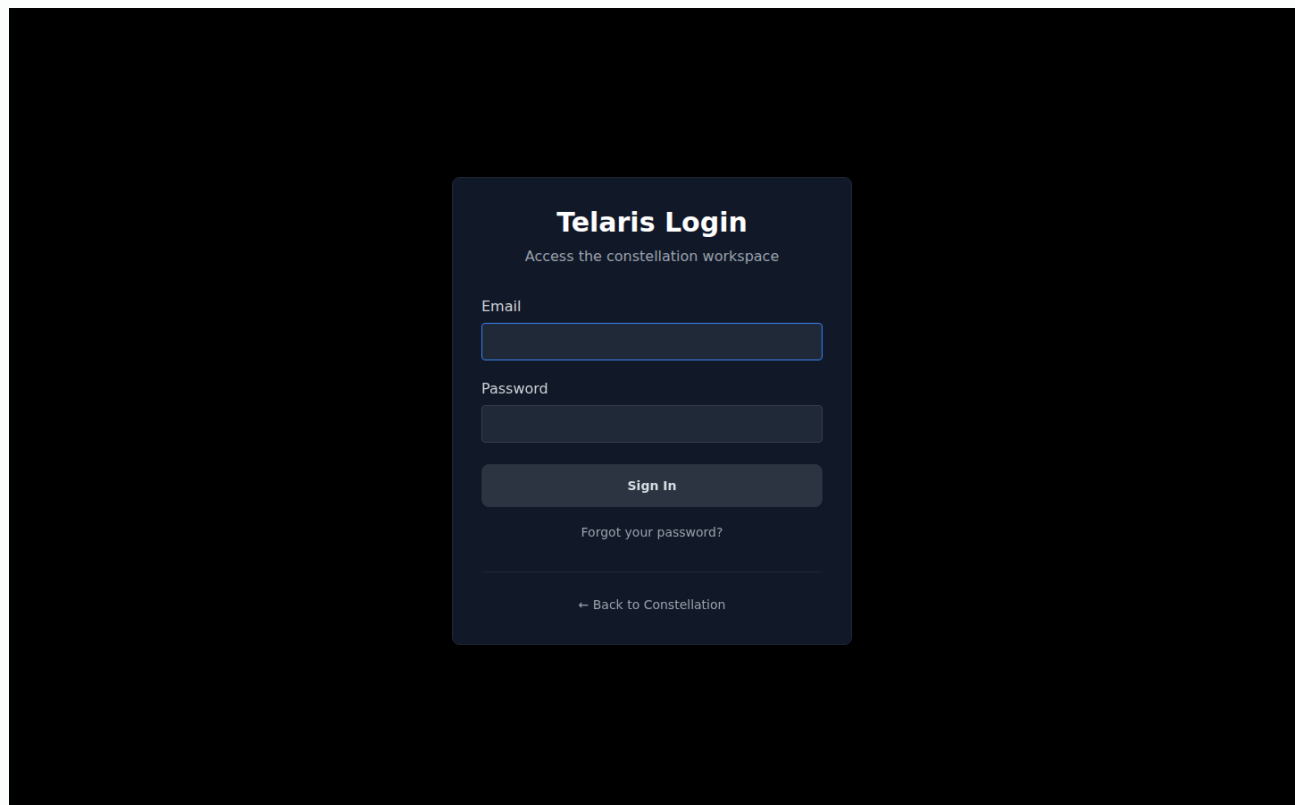

Three things, supplied by your operator (the person who runs your Telaris instance):

- The address of your instance, like `https://your-instance.example`.
- Your editor email.
- Your password.

If anything is missing, ask your operator. Then come back here.

Step 1: Sign in

Open your instance's address in any modern browser. Enter your email and password. Select **Sign In**.

If you forget your password, the **Forgot your password?** link sends a reset email.

Step 2: Pick a galaxy

After signing in, you land on the **Edit Wormholes** page. The dropdown labelled **Current Galaxy** at the top picks which galaxy you are authoring in. Choose the galaxy you have been asked to add content to.

Edit Wormholes

Welcome, Manual Capture (Editor)

A galaxy is the container your wormholes will live in. Every wormhole belongs to exactly one galaxy.

Step 3: Create a wormhole

Select **New Wormhole** (next to the wormhole count). A form opens:

Add New Wormhole

Name *

Galaxy

Wormhole type

Keywords

Accentuate Wormhole

Show Keywords

Description

URL

Primary visual

Icon URL / File

Audio URL / File

Fill in three things, in order. Skip the rest for now.

1. **Name.** What this wormhole is called. The visitor reads this label in the 3D scene. Required.
2. **Description.** The body text the visitor reads when they open the wormhole. Write in your own voice; basic markdown formatting works.
3. **Keywords.** Type one and press **Enter** (or comma) to add it as a chip. Two or three is enough. Keywords are how this wormhole connects to others; a wormhole tagged *coast* connects to every other wormhole tagged *coast*, both inside this galaxy and across the rest of the instance.

Leave **Wormhole type** on **Object**; that is the default for a content-bearing wormhole.

Step 4: Add an image (optional)

Still inside the same modal, scroll down to **Primary visual**. The **Image** tab is the default.

- To attach an image **from your computer**: select **Choose File** and pick the image.

- To attach an image **already on the web**: paste its URL into the field.

If you want the image to render as the wormhole's icon in the 3D scene (instead of the galaxy's default theme icon), toggle **Use as wormhole icon** on. Otherwise the image only appears inside the wormhole's info card when a visitor opens it.

The image is the most common kind of media. The same modal also supports video, audio, and PDF; the full Editor Manual walks through each. For your first wormhole, an image is plenty.

Step 5: Save

Select **Save** at the bottom of the modal. Your wormhole appears in the wormhole list immediately.

To see it as a visitor will, find the **View** button next to the galaxy picker on the editor home; it opens the galaxy in the 3D scene in a new tab. Your wormhole is in there.

What's next

You have the loop. From here:

- **Repeat.** Make another wormhole. Then another. A galaxy of one wormhole is technically valid; a galaxy of ten starts to feel like an archive.
- **Explore.** This Quick Start covered the smallest possible path. The editor surface has much more on offer than what you have just seen. Click around the wormhole modal you already know; try the **Video (MP4)**, **PDF**, and audio fields; open the **Settings** button next to the galaxy picker and look at the discovery toggles; open the **Canvas** button and see the keyword canvas; try the **Bulk by keyword** button on the editor home. Nothing in the editor is destructive on first read; opening a modal does not change anything until you save.
- **Read the full Editor Manual.** A complete user manual is available at <https://www.telaris.ca/docs/editor-manual.pdf>, in fifteen chapters that walk through every surface in detail: galaxies, every media type, portals between galaxies, the keyword canvas, visitor views, tours, multigalaxy work, editorial choices, troubleshooting, and a glossary. Skim its table of contents and dip into the chapters you need; nothing in this Quick Start is invalidated by what you will find there.
- **Use keywords deliberately.** Two or three precise keywords per wormhole connect more usefully than ten generic ones. The keyword chips you assign are how visitors discover the web you are building.

WHEN SOMETHING GOES WRONG

If a page will not load, a button does nothing, or a message appears that you do not understand, this is the moment to reach out to the operator who runs your instance. They keep the lights on. Everything in this Quick Start assumes the instance is working as expected.
